Plan for Dissemination

Using observations and the hypothesis method, we were able to gather data that shows a lack of efficiency on the Panopto platform. Using the hypothesis method, it was mathematically calculated that the hypothesis of the paper was not rejected. The data gathered is presented by the time it took the different test subjects to perform the tasks given to them, which tested different features of the Panopto platform. Their users should not struggle with tasks that should only be a search away. For a video-sharing platform, the goal is to share videos, but when users cannot find said videos, the purpose of the site starts to crumble.

Stakeholders

- Educators: Could provide insights into how to optimize the use of Panopto to create more effective educational content.
- Students: Could provide insights into how to use Panopto to maximize learning outcomes.
- Businesses: Could provide insights into how to optimize the use of Panopto to create more effective training content and improve employee performance.
- Researchers: Could provide valuable data and insights that could inform future research in this area.
- Other e-learning platforms: Could provide insights into how to optimize the use of a video sharing tool to create more effective educational content.
- Panopto: Could provide valuable data and insights for future improvements.

Steps for improvement

1. Identify "problem areas" within the platform by analyzing the findings from the research.
2. Update the platform with fixes to solve the identified problems.
3. Perform additional user tests to confirm that the implemented changes improves the usability of the platform.

Overall, Panopto provides a range of channels, resources and other forms of media to help you get the most out of their platform. The easiest methods of communication are:

1. *Panopto Help Center*: The Panopto Help Center is the easiest and quickest resource for communicating and accessing information on how to use the platform.
2. *Email*: You can email Panopto's support team at support@panopto.com.
3. *Social media*: Panopto has an active presence on social media platforms such as Twitter, Facebook and LinkedIn.

When disseminating the results of our research paper to Panopto, or any stakeholder in general, it is important to keep in mind that the audience may not have the same level of technical expertise as we do. As IT students, we should aim to present our findings in a clear, concise and easy to understand manner.

To begin with, we will present a brief summary of our findings, followed by a presentation of our visuals, which in this case is the table/graph including the task completion times of different

participants. After this is done, we will provide the stakeholder group with recommendations as to what can be done in order to improve the efficiency of the usability of Panopto. All of this should be performed using simple language, in the format of a presentation, which we believe is an effective way of engaging our audience and making sure the key takeaways are clear.
